## The "New Normal" for Indoor Air Quality and the International Code Council (ICC)-Codes

Moving forward towards a Post-COVID environment

Presenter: Guy Tomberlin, Vice President Plumbing Mechanical and Fuel Gas Programs International Code Council

### Objectives:

- Identify the importance of code applications pertaining to IAQ.
- Define the "new normal" in Indoor Air Quality (IAQ).
- Describe what the "new normal" in IAQ may mean in different applications.
- More clearly understand how to evaluate systems to better embrace the "new normal" in IAQ.
- Explain how to incorporate the "new normal" in IAQ into different type HVAC Systems.

## What is the definition of the New Normal in IAQ?

- Truth-is there is not one generic "new normal" for all applications.
  - No one-size fits all
  - No silver bullet
- IAQ is based on individual specific applications, including things like:
  - The type of structure
  - The type of occupancy
  - The existing equipment
  - The needs of the occupants
  - The ability to alter equipment and practices

## What is the New Normal for IAQ?

- It may be different for everyone.
- Some may want to replace, upgrade and or retrofit systems.
- Some may already have state of the art equipment.
- Some may learn that changing system components is more challenging than expected.

#### What do the codes have to do with IAQ anyway?

#### International Mechanical Code

• New HVAC/OA/IAQ system design and installation, includes the duct systems.

#### • International Existing Building Code

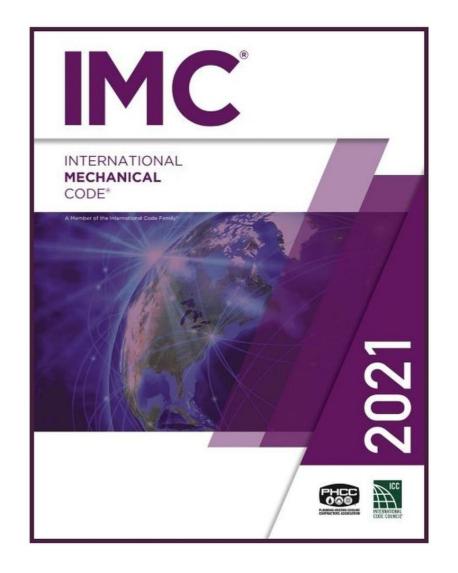

- Alterations of existing HVAC/OA/IAQ systems.
- International Property Maintenance Code
  - Continued maintenance and operation of HVAC/OA/IAQ systems.

#### International Mechanical Code

- Encompasses new construction design, engineering, and installation details for HVAC mechanical systems.
  - Air balance required for new systems.
- Original permitting information should be obtainable through permitting records.
- Identify the code used at the time of construction.

Why is the original design important?

## Some have the expectation that <u>all</u> systems meet current code requirements....not realistic.

HVAC systems shall be maintained as they were permitted, designed and installed.

Some buildings may have been designed using codes that are decades old.

As uses and occupancies change, so do the ventilation requirements.

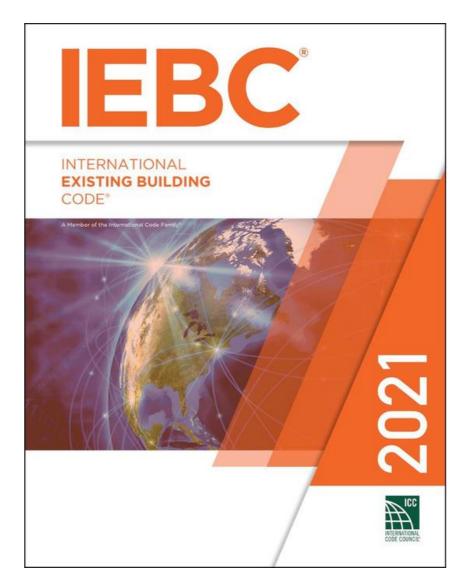

Sometimes Air-Balancing gets overlooked as tenants' transition in, out and around.

#### International Existing Building Code

- Used when remodeling and retrofitting existing structures.
- Provides construction guidance based on the 3 levels level of activity from replacement operations (Level 1) to complete renovation alterations (Level 3).
- Check for permitting requirements!

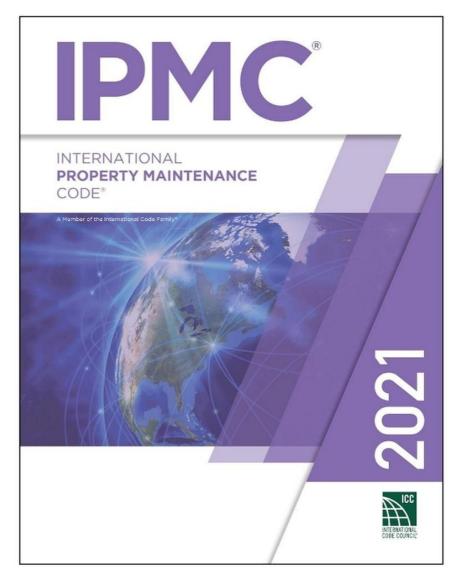

#### International Property Maintenance Code

- Requires that all mechanical equipment is maintained in a safe working condition and shall be capable of performing the intended function.
- Duct systems shall be maintained free of obstructions and capable of preforming the required function.

## Are permits required?

- Yes-well....maybe
  - Alterations to any required HVAC appliances and equipment.
  - Additional permanent equipment.
    - Fans (exhaust, make-up, circulation)
    - Electronic filtration
    - Humidifiers
  - Installation of new permanent appliances and equipment.
    - May require plans as well.

#### Consult with the Authority Having Jurisdiction (AHJ)!

## Are permits required?

- No-well...maybe
  - Portable cord and plug (re)movable type equipment.
    - Room air purifiers.
    - Room humidifiers.
    - Room fans.

Keep in mind some types of portable units may impact existing system performance and efficiency. For example, room humidifiers.

Consult with the Authority Having Jurisdiction (AHJ)!

### In Summary

- Fully evaluate your specific IAQ needs as a holistic system working together within a structure or space.
- Determine what actions you intend to undertake.
- Determine which codes and standards are applicable.
- Check with AHJ to determine permitting and plan submission needs.
- Commission and air balance final product.

## Thank You!

Guy Tomberlin Vice President, PMG Programs Government Relations Cell: 202-603-0792 gtomberlin@iccsafe.org

#### Ron Cosby

Technology and Thermal Systems Leader, Americas Commercial HVAC

# TECHNOLOGIES

## Your Building's IAQ Future

#### Taking a holistic view

A building's interconnected systems and the interactions between those systems result in an occupant experience that is influenced by IAQ.

#### ASSESS

- Analyzing current state/determining needs
- Projecting the future of the space

#### MITIGATE

- Developing occupant-centric strategies
- Implementing the solutions
- Improving energy efficiency and sustainability

#### MANAGE

- Ongoing optimization
- Continuous managing and monitoring

## Regaining Trust In Your Building Begins With Assessing Its Current Capabilities

#### Indoor Air Quality Assessment

- Fact based, data-driven analysis of your building's indoor air quality
- Aligned to latest CDC/ASHRAE<sup>®</sup> guidelines for operating HVAC systems
- Recommend ways to improve IAQ today
- Highlight opportunities for future upgrades

The Four Key Pillars of IAQ

#### Why an IAQ Assessment?

#### Confidence

Staff and public want to know leaders are addressing their concerns

Assess

Internationa

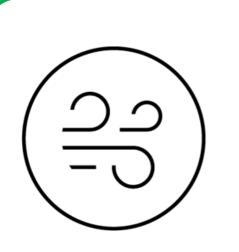

#### Resilience

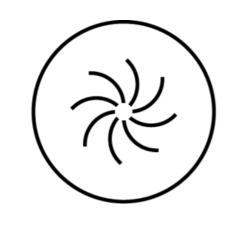

Today it's a global pandemic; what's next? IAQ will be an ongoing focus

#### Sustainability

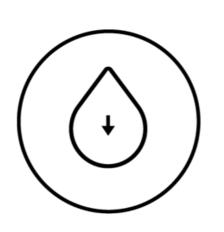

Ensure clean indoor air efforts are in tune with community values

#### The Four Key Pillars of IAQ

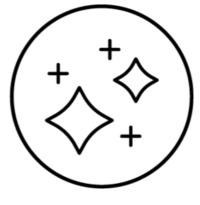

Dilute Making sure plenty of fresh outdoor air dilutes the buildup of indoor contaminants through proper ventilation **Exhaust** Getting exhaust air out is equally important, especially air from kitchens, restrooms, and combustion systems

Contain Keeping indoor humidity levels within the ASHRAE<sup>®</sup>recommended range maximizes occupant comfort and reduces the risk of microbial growth

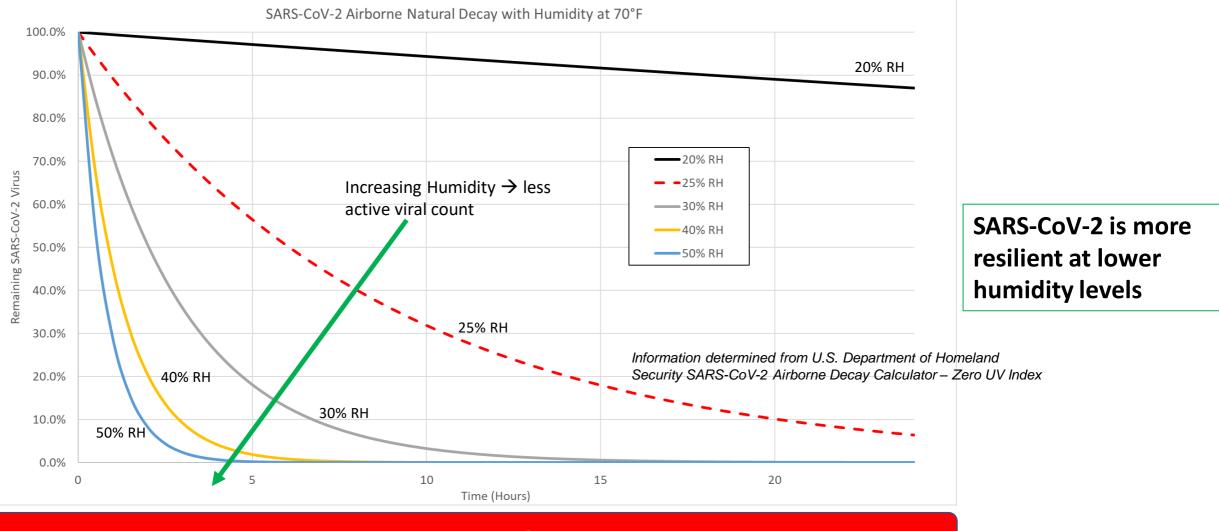

Clean

#### Humidity Control - Increase Humidity $\rightarrow$ Reduce Risk

SARS-CoV-2 will naturally deactivate at higher humidities  $\rightarrow$  Helps reduce need for other abatements

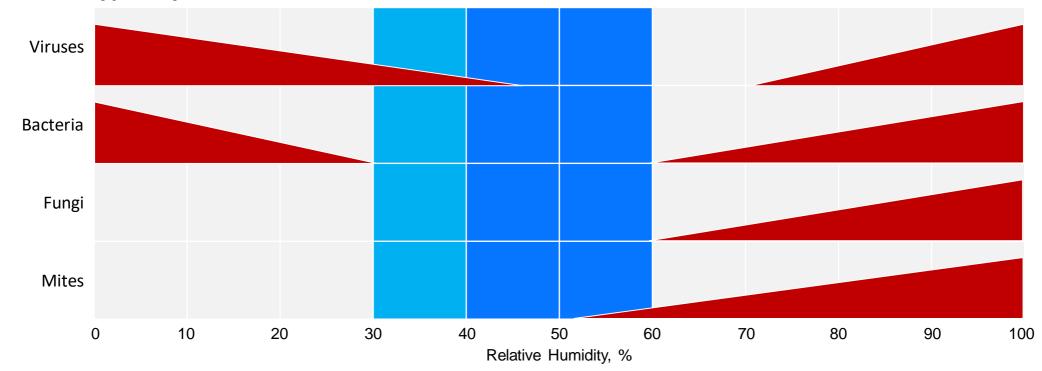

Mitigate

## Contain: Humidity Control – Helps Reduce Viral Load and Lessen Impact

Viruses are typically less stable between RH of 40-60%

Sweet spot 40-60% relative humidity for viruses

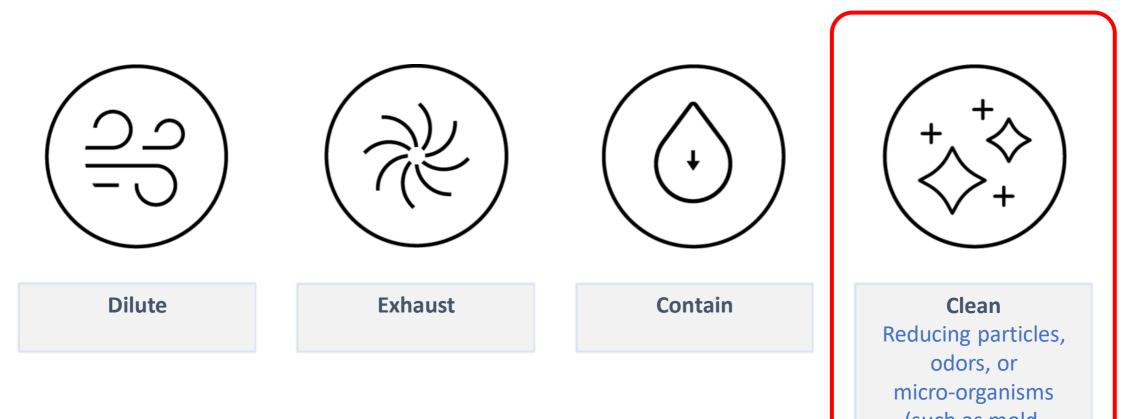

Information from 2016 ASHRAE® Handbook, HVAC Systems and Equipment

Mitigate

#### The Four Key Pillars of IAQ

(such as mold, bacteria, and viruses)

## Cleaning Technology Efficacy

- In order to better describe our IAQ Cleaning Technology portfolio, efficacy testing on multiple technologies was conducted at a third-party lab
- Technologies were examined for two scenarios which define potential customer scenarios
  - In-duct In-equipment capability and/or in-duct
  - In-room Devices located within the room standalone
- Consistent testing methodology to compare technologies against each other and provide industry-wide testing of IAQ cleaning devices
  - Virus reduction capability aerosolized and surface test with MS2 virus
  - Bacteria reduction capability aerosolized only with Staphylococcus aureus
  - VOC reduction capability Formaldehyde and toluene
  - Ozone generation

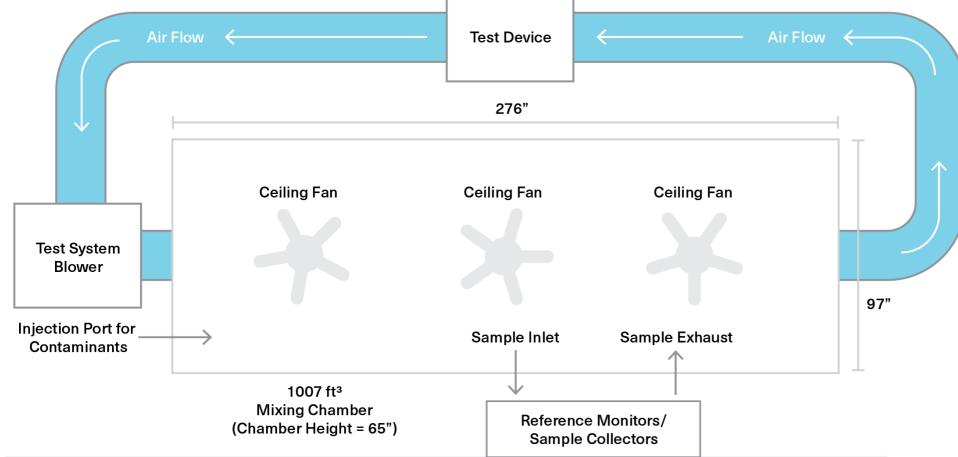

No silver bullet to a building's IAQ problems – no singular technology addresses everything

Mitigate

#### Testing Chamber – In-Room and In-Duct

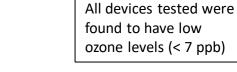

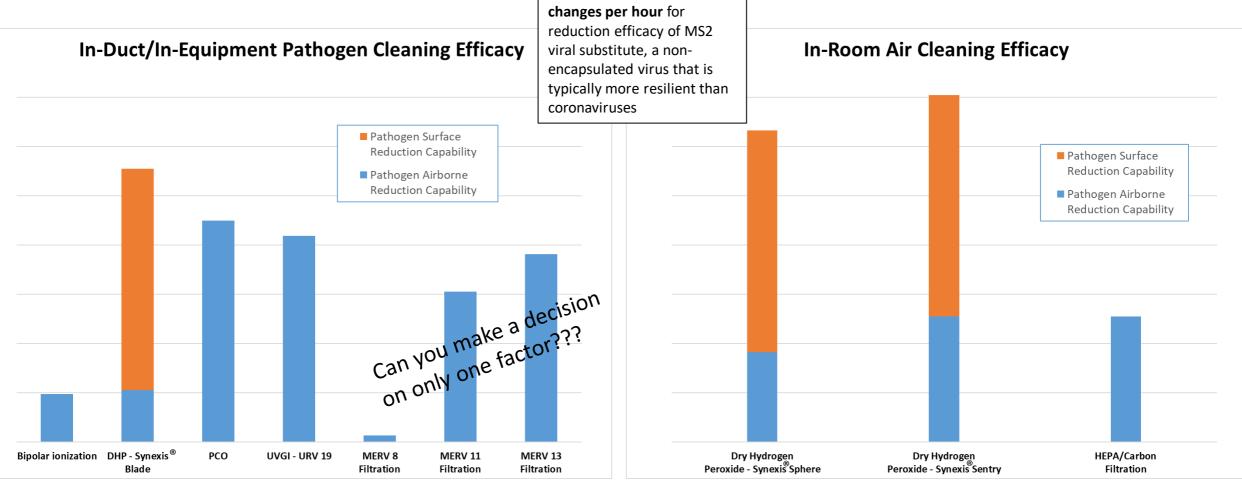

Consistent testing methodology and process in a large chamber – not a breadbox

## IAQ Cleaning Technology Comparison:

Results shown are for 6 air

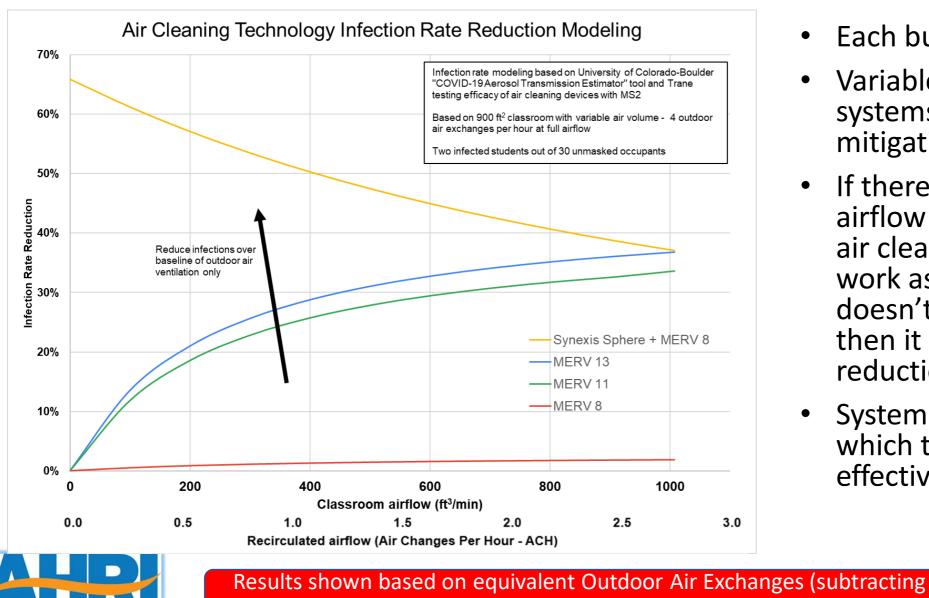

All devices tested worked to reduce viral count on airborne MS2 Only dry hydrogen peroxide generation devices reduced viral count on surfaces

## IAQ Cleaning Technology Comparison:

natural decay)

we make life better®

- Each building is different!
- Variable Air Volume (VAV) systems require different mitigations
- If there's less recirculated airflow then filters and other air cleaning devices may not work as effectively → if the air doesn't go through the filter then it won't work on virus reduction
- System makeup matters for which technology may be most effective for your building use

Mitigate

#### Manage – The Future of IAQ

#### Controls Platforms are Evolving for the IAQ Future

- Standalone, in-room or building-wide control and communication/dashboard options
- Analyze air quality trends and source potential problems
- Track improvements over time
- Meet measuring performance requirements set by WELL, RESET or your own team
- Engage stakeholders with visual demonstration of results
- Optimize comfort and IAQ for balancing risk mitigation with energy consumption

Confirm impact, build and maintain confidence of the people in your building

WEL

2020

## The Future of Building IAQ Starts NOW!

- Each building is different → Work with a professional to provide a systematic approach for assessment for your building
- Develop a mitigation plan that involves all four pillars of IAQ – Dilute, Exhaust, Contain, and Clean
- Manage your building through active controls and service to ensure that your building IAQ and function is optimized for both use and its occupants

## Questions?
